

### **Amendment to the Specification**

There was a typographical error in the prior amendment to the specification [in the Response to the First Office Action]. Instead of showing the deletion of the element specified as “160”, it was shown as deleting “150”

Please replace paragraph 2 on page 9 with following amended paragraph:

The outer surface of the first compartment **122** has an arcuate or semi-circular shaped retaining flange **150**. Each container **152** has a perimeter lip **156** formed outward from the rim of the dish ~~160~~. Each container **152** has an air and watertight removable lid. Mounted on the top of the first compartment **122** is a rotating latch **154**. When attached to the handle assembly **110**, the containers **152** sandwich the first compartment **122**. The attachment process includes sliding the lip **156** under the edge of the flange **150** and rotating the latch **154** to secure the container **152** in place. However, it will be appreciated that a number of different types of conventional fasteners may be used to removable attach the container to the outer surface of the housing. The container **152** also functions as serving dish. The container opening is large enough to allow the dog easy access and permit quick clean up.

### **Clean Copy of Amended Paragraph of the Specification**

The outer surface of the first compartment **122** has an arcuate or semi-circular shaped retaining flange **150**. Each container **152** has a perimeter lip **156** formed outward from the rim of the dish . Each container **152** has an air and watertight removable lid. Mounted on the top of the first compartment **122** is a rotating latch **154**. When attached to the handle assembly **110**, the containers **152** sandwich the first compartment **122**. The attachment process includes sliding the lip **156** under the edge of the flange **150** and rotating the latch **154** to secure the container **152** in place. However, it will be appreciated that a number of different types of conventional fasteners may be used to removable attach the container to the outer surface of the housing. The container **152** also functions as serving dish. The container opening is large enough to allow the dog easy access and permit quick clean up.
